# We are close to you...

As time goes by, we feel extremely satisfied and proud to be able to contribute to and form part of a responsible, safe industry which is striving to build a better world and a safer future. We are convinced we can offer you a solution that will meet your expectations.

## Who we are

### History:

Founded in 2010, our company embarked on a journey driven by a vision to revolutionize the mechanical seal industry. Since our establishment, we have evolved into a global leader in mechanical seals. Through relentless innovation, exceptional quality, and customer-centricity, we have built a rich history of delivering reliable, customized solutions that optimize efficiency and exceed expectations.

### Mission:

Our mission is to be a leading manufacturer of high-quality mechanical seals, delivering innovative and reliable sealing solutions that meet the diverse needs of our customers. We strive to exceed customer expectations by providing exceptional products, exceptional service, and exceptional value. Through continuous improvement and a commitment to excellence, we aim to contribute to the success and efficiency of industries worldwide.

### Vision:

Our vision is to be the global benchmark for mechanical seals, recognized for our unwavering dedication to quality, performance, and customer satisfaction. We aspire to be the preferred choice for companies seeking superior sealing solutions that enhance their operational reliability, reduce downtime, and improve overall efficiency. By fostering a culture of innovation, collaboration, and sustainability, we aim to shape the future of sealing technology and make a positive impact on the industries we serve.

### Strategy:

**Reliability** and **Availability** are at the core of our strategy. We are committed to meeting our obligations and ensuring timely product delivery, earning the trust of our customers as a reliable partner. With a focus on **Accessibility** and **Adaptability**, we offer expert guidance and tailored solutions through our extensive product range and efficient processes.

### Accessibility:

Please feel free to reach out to us via traditional or modern communication channels. We are committed to promptly and effectively addressing your needs with tailored solutions.

### Reliability:

We are regarded as a trusted partner by our customers due to our unwavering commitment to meeting our obligations.

### Adaptability:

We offer expert advice and guidance to our customers, leveraging our design and manufacturing capabilities to customize products and services according to their specific requirements.

### Availability:

Our extensive product range and efficient processes enable timely delivery of requested products.

### Our Values:

We are guided by a set of core values: integrity, innovation, collaboration, customer-centricity, quality excellence, and environmental stewardship. With integrity as our foundation, we promote innovation through collaboration, prioritize customer needs, ensure quality excellence, and uphold our commitment to environmental stewardship.

# We believe in:

## COLLABORATION:

Encouraging teamwork, cooperation, and open communication to foster a culture of collaboration that drives creativity, innovation, and overall organizational success.

## ENVIRONMENTAL STEWARDSHIP:

Taking responsibility for sustainable practices, reducing environmental footprint, and contributing to a greener future.

## INTEGRITY:

Conducting business with honesty, transparency, and adherence to ethical standards.

## INNOVATION:

Embracing a culture of continuous improvement, research, and development to drive advancements in mechanical seal technology.

## CUSTOMER-CENTRICITY:

Placing the needs of customers at the forefront, understanding their challenges, and delivering tailored solutions that exceed expectations.

## QUALITY EXCELLENCE:

Commitment to delivering products and services of the highest quality, adhering to stringent quality control measures and surpassing industry standards.

## Food and pharma

The food and pharma sectors are especially demanding with respect to safety in their processes. It is very important to prevent contamination with the manufactured products and the halting of production lines during the entire work flow.

For this reason, the use of CIP (Cleaning in place) or SIP (Sterilisation in place) processes is quite usual.

The complex chemical mixtures (alkaline solutions) used in CIP processes may damage the seals of the mechanical seals in a short time, and in SIP, high temperatures reaching values of up to 150° C can destroy conventional elastomer materials.

Due to these extreme conditions, the use of elastomers in resistant materials such as EPDM peroxide, FFKM and Aflas® is essential, and they must also comply with the strictest compulsory standards required in these industries: FDA, CE 1935, KTW, WRAS, 3-A, etc.

Many different kinds of machines exist for transferring temperature-sensitive products, viscous substances, fluids with particles or particles in suspension: screw pumps, stirrers, mills, homogenisers, reactors and mixers. The most appropriate mechanical seal design is the hygienic one which reduces the possibility of product remains being deposited and not eliminated during CIP/SIP processes, which could give rise to sources of contamination.

Applications	Requirements or critical conditions of the application	Type of seal recommended
Sauces:	Fluids containing particles	→ Wave spring seal (protected spring), conical spring seal, multispring seal (double) and single cartridge seal.
Sweets and chocolate	Viscous products Products with a high sugar content	→ Double cartridge seal, reservoirs, wave spring seal (protected spring) and bellows seal (metal).
Water and soft drinks:	Fluids without particles	→ Conical spring seal and bellows seal.
Beer:	CIP/SIP processes	→ Conical spring seal and wave spring seal (protected spring).
Dairy products (milk, yoghurts, butter, cheese, fats...)	Viscous products CIP/SIP processes	→ Wave spring seal (protected spring), conical spring seal and multispring seal (protected).
Creamy products, ointments, cosmetics, gels, etc	Viscous and sticky products	→ Multispring seal (double), double cartridge seal, reservoirs and wave spring seal (protected spring).

Determining the mechanical seal design and the appropriate materials for each application is essential in order to cut costs.

## Sectors

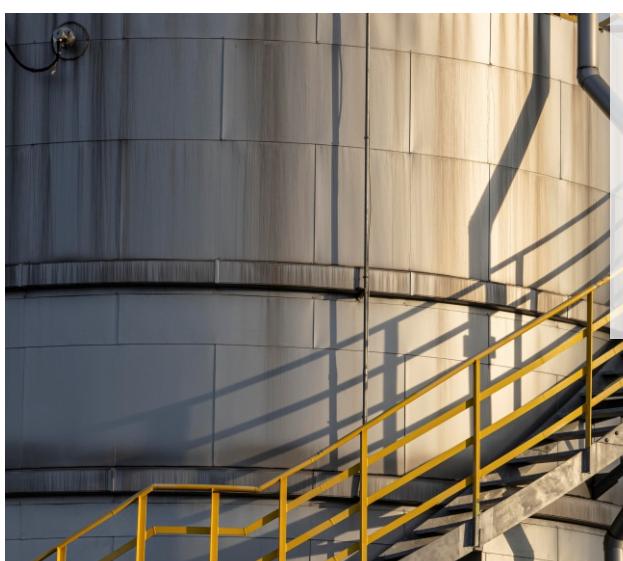

### Chemical

In the chemical industry, the habitual processes require sealing elements for materials with high chemical resistance. For transferring very aggressive or corrosive chemical fluids that are clean or with particles and have high viscosities, along with high temperatures and pressures, the mechanical seal materials and the type of assembly must be correctly defined: single, double, external or in accordance with API plans.

Furthermore, the applications require sealing systems that guarantee safety, preventing the leakage of corrosive or flammable products that could enter the atmosphere.

In this sector the ATEX certification is often required, to ensure equipment's safety when working in explosive environments.

All the above gives rise to extremely demanding requirements for the mechanical seals and for the auxiliary elements supplied with them: LTS or LQT reservoirs, or elements such as cyclones.

Not only is it necessary to pay attention to the design of the mechanical seal, but also to consider the materials used to make its components: sintered silicon carbide contact surfaces (Q1), fluorinated elastomeric seals (FKM) or high resistance alloy springs (Hastelloy®C) are an indispensable requirement.

Applications	Requirements or critical conditions of the application	Type of seal recommended
<b>Chlorine and its by-products, acids, caustic products:</b>	Corrosive fluids	→ Bellows seal (PTFE).
<b>Detergents:</b>	Viscous products	→ Multispring seal (double).
<b>Fertilisers:</b>	Chemically aggressive fluids	→ Bellows seal (PTFE).
<b>Varnishes and paints:</b>	Sticky products	→ Double cartridge seal, reservoirs and wave spring seal.
<b>Pulp and paper:</b>	Paste-like products	→ Double cartridge seal, reservoirs, multispring seal, (external arrangement) and wave spring seal.

## Water treatment

In water treatment operations, different processes are carried out in order to obtain a product that complies with the stringent health and legal legislation of each country.

Even though water is the main element of the whole process and the main fluid used, the difficulties posed in sealing it are just as challenging as in other sectors.

During the different treatments to which water is subject, the mechanical seals may come into contact with sediments, organic matter, dissolved substances such as calcium and magnesium (hard water), sulphate and carbon dioxide (acid water), manganese (sewage water), nitrates (water contaminated by fertilisers), etc.

Although standard seals are often sufficient for most applications in this (supplying freshwater or transporting wastewater), in other cases the design of the mechanical seal and the materials must be carefully designed.

Applications	Requirements or critical conditions of the application	Type of seal recommended
Domestic water treatment		→ Bellows seal and conical spring seal.
Desanding/degreasing treatment	Fluids with a high particle content	→ Single cartridge seal, double cartridge seal, auxiliary elements (reservoirs cyclones) and wave spring seal.
Decanting		
Deodorising	Fluids containing chemicals: (sodium hypochlorite, sodium hydroxide, sulphuric acid)	→ Bellows Seal (PTFE).

# Sectors

## Maritime

Pumps installed on ships must be extremely reliable and durable. Use of different machines: cooling pumps, fire fighting pumps or boiler supply pumps, meaning that the types of mechanical seals used in this industry are quite diverse. The main applications are for:

- Cooling machinery
- Firefighting systems.
- Feeding boilers.
- Pumping ballast water.

A wide range of mechanical seal designs exist for this type of pumps, which operates in especially difficult conditions with high salt concentrations (this parameter varies, depending on the sea), at high pressures, etc.

Within this scope, not only is it important to locate spare parts to make the repair, but it is also important to select the right materials for the contact surfaces and metal parts of the seal. It is essential to determine a structure that permits easy mounting, increases the pump's useful life and reduces maintenance costs.

Applications	Requirements or critical conditions of the application	Type of seal recommended
Sea water:	High salt concentration High pressure	→ Multispring seal: Hastelloy®C materials multispring seal (balanced)
Sump pumps:	Complex assemblies High salt concentration	→ Single cartridge seal (split). → Single cartridge seal, axial spring seals: conical spring, wave spring seal and multispring seal.

Sector	Double cartridge seal	Single cartridge seal	Auxiliary elements	Wave spring seal	Multispring seals	Axial spring seals	Bellows seals

# AMS10D

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 18$  to  $100$  mm    $p = 16$  kg/cm<sup>2</sup>

$v = 20$  m/s    $t = -15$  to  $+200^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

Double seal for working with barrier fluids in which the springs are isolated from the fluid product.

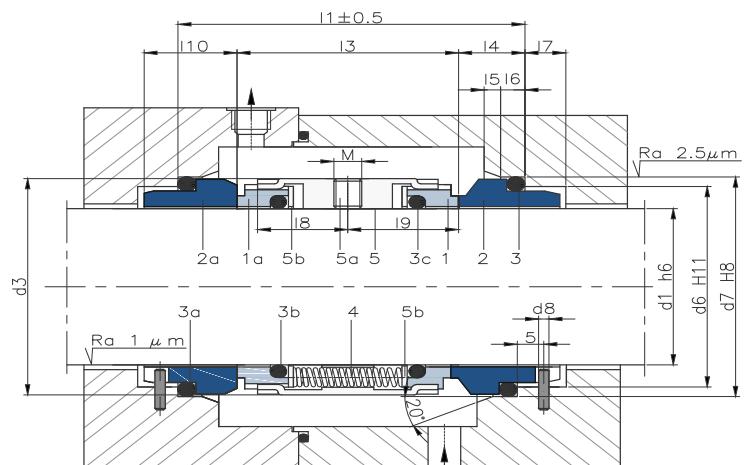

API 53A and AP I54 assemblies.

Recommended in applications with toxic, pollutant or potentially dangerous products in which safety is an important factor. Available with a pumping ring on the casing to reduce the temperature between the contact surfaces and facilitate the barrier fluid movement (AMS10-F). Available in a balanced version with a stepped shaft ( AM10DB).

Contact surface kits available.

## COMPONENTS:

- |    |                            |
|----|----------------------------|

# AMS14

## SECTORS:

## CHARACTERISTICS:

- Balanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 18$  to  $100$  mm    $p = 14$  kg/cm<sup>2</sup>

$v = 15$  m/s    $t = -15$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

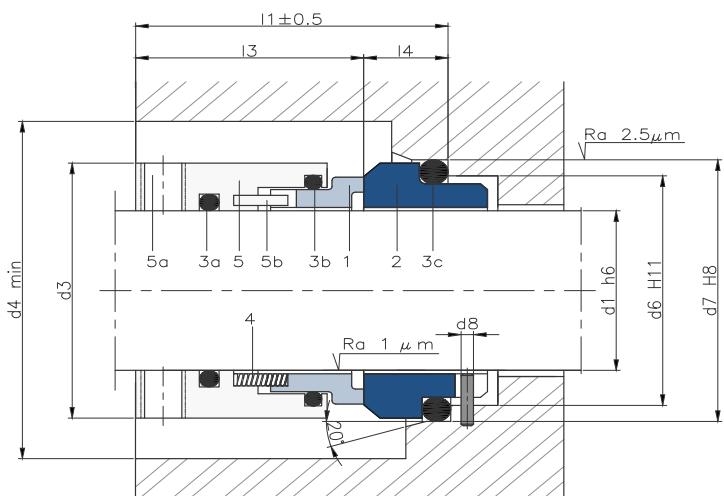

## DESCRIPTION:

The springs are not in contact with the fluid. Ideal for working with particle-laden fluids in which standard designs tend to become blocked.

Internally balanced, with no need for a stepped shaft. Suitable for working in applications with high pressures. The O-ring resting on the shaft does not cause wear as there is no axial movement (changes in pressure).

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3a O-rings
- 3b O-rings
- 3c O-rings
- 4 Springs
- 5 Metal frame
- 5a Set screws
- 5b Coupling pin

Dimensions subject to changes or modifications.

**SECTORS:****CHARACTERISTICS:**

- Unbalanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

**OPERATING LIMITS:**

$d_1 = 20$  to  $100$  mm    $p = 12$  kg/cm<sup>2</sup>

$v = 20$  m/s    $t = -40$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

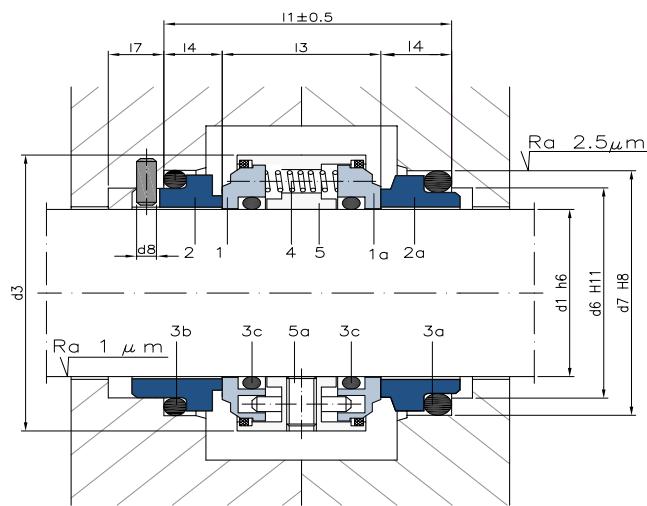

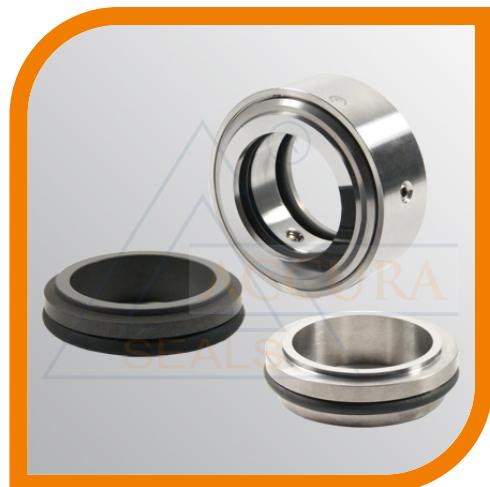

**DESCRIPTION:**

Double seal for working with barrier fluids in which the springs are isolated from the fluid product. API 53A and AP I54 assemblies.

Recommended in applications with toxic, pollutant or potentially dangerous products in which safety is an important factor.

**COMPONENTS:**

- |    |                            |

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

## OPERATING LIMITS:

 $d_1 = 14$  to  $100$  mm    $p = 10$  kg/cm<sup>2</sup> $v = 20$  m/s    $t = -15$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

The set of springs placed around the contact surface of the rotating part generates a more uniformed load than in models with a single spring.

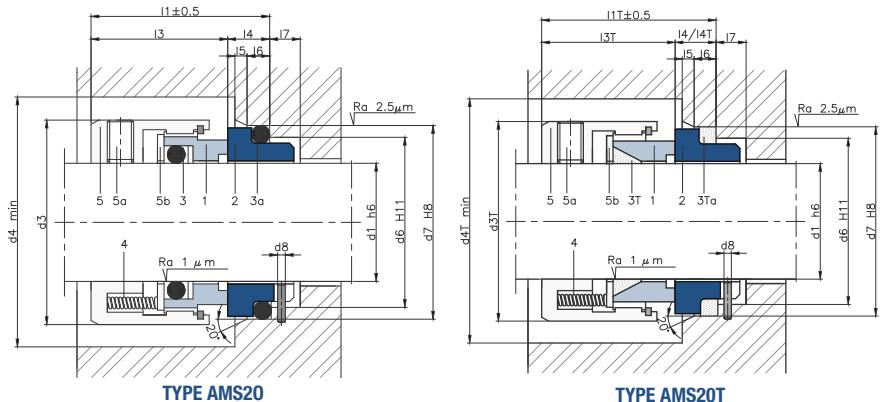

The AMS20 is suitable for many different applications. Seal compliant with standard EN 12756 (KU).

The AMS20T uses a PTFE wedge as a secondary seal and is appropriate for highly aggressive chemicals and for thermal oils with high temperatures. The version in inches has a standard stationary PF. L22 part.

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3T PTFE wedge
- 3a O-rings
- 3Ta PTFE gasket
- 4 Springs
- 5 Metal frame
- 5a Set screws
- 5b Ring

Dimensions subject to changes or modifications.

**SECTORS:****CHARACTERISTICS:**

- Balanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

**OPERATING LIMITS:**

$d_1 = 14$  to  $100$  mm    $p = 60$  kg/cm<sup>2</sup>

$v = 25$  m/s    $t = -15$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

The balanced contact surface design allows the mechanical seal to be used in applications with high pressures without suffering premature wear.

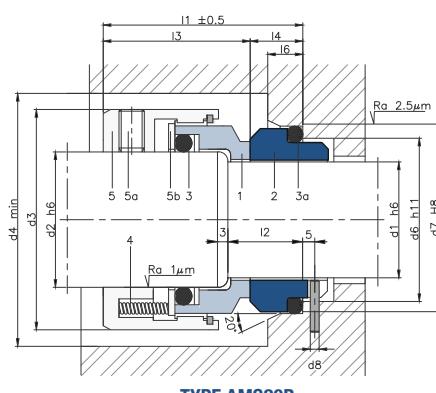

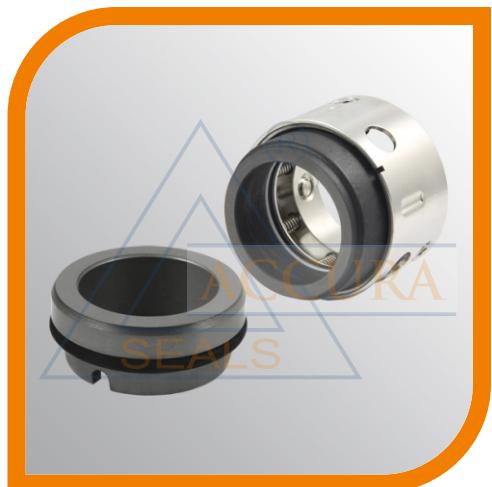

The set of springs placed around the contact surface of the rotating part generates a more uniformed load than in models with a single spring.

It can be supplied with PTFE wedge for highly aggressive chemicals with high temperatures.

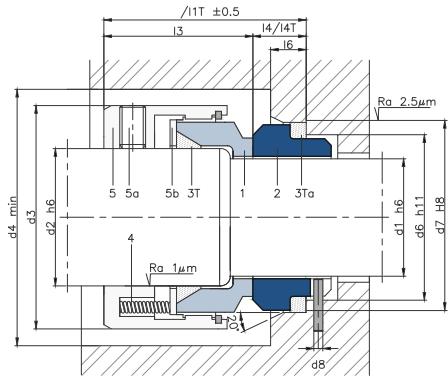

Seal compliant with standard EN 12756 (KB).

**COMPONENTS:**

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3T PTFE wedge
- 3a O-rings
- 3Ta PTFE gasket
- 4 Springs
- 5 Metal frame
- 5a Set screws
- 5b Ring

# AMS22

**SECTORS:**

**CHARACTERISTICS:**

- Unbalanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

**OPERATING LIMITS:**

$d_1 = 20$  to  $100$  mm    $p = 12$  kg/cm<sup>2</sup>

$v = 20$ m/s    $t = -40$  to  $+200^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

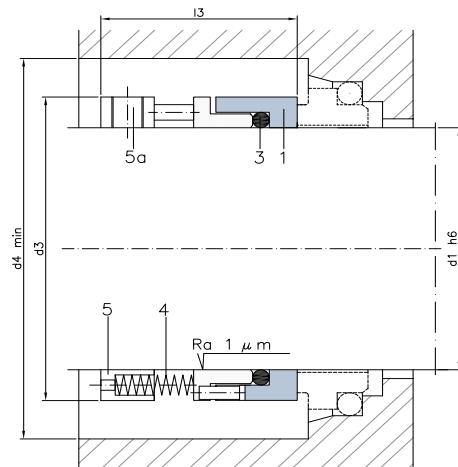

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**COMPONENTS:**

- |    |                          |
|----|--------------------------|
| 1  | Rotating contact surface |
| 3a | O-rings                  |
| 4  | Springs                  |
| 5  | Metal frame              |
| 5a | Set screws               |

**DESCRIPTION:**

The contact surface of the rotating part can be detached, which makes this model extremely versatile as it is easy to exchange contact surfaces made of different materials.

# AMS26

**SECTORS:**

**CHARACTERISTICS:**

- Balanced.
- Independent Rotation System
- Multispring

**OPERATING LIMITS:**

$p = 50 \text{ kg/cm}^2$        $v = 50 \text{ m/s}$

$t = -20 \text{ to } +140^\circ\text{C} (*)$

(\*) The temperature resistance depends on the material of the secondary seals used.

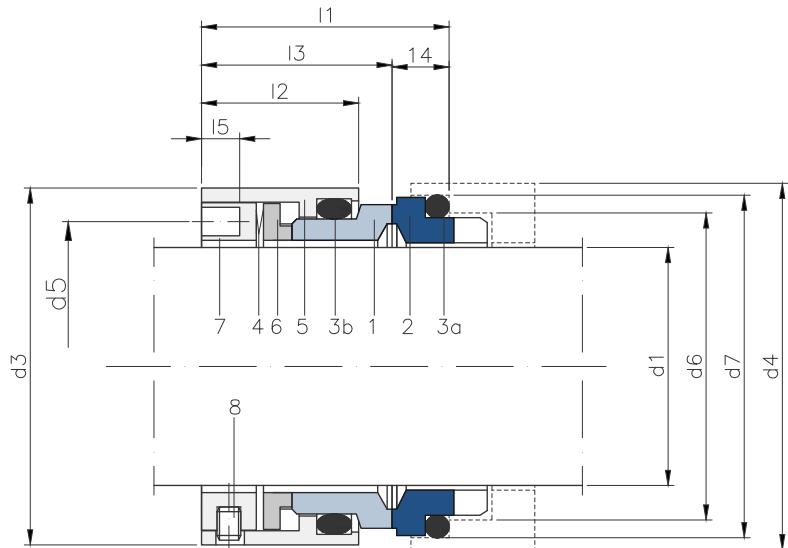

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

Balanced mechanical seal with protected springs to prevent them from blocking when in contact with sticky or viscous fluids. The O-ring on the shaft is static, thereby preventing "fretting" of the shaft.

**COMPONENTS:**

- |    |                            |
|----|----------------------------|
| 1  | Rotating contact surface   |
| 2  | Stationary contact surface |

# AMS28

**SECTORS:**

**CHARACTERISTICS:**

- Balanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.
- External mounting.

**OPERATING LIMITS:**

$d_1 = 25$  to  $175$  mm    $p = 15$  kg/cm<sup>2</sup>

$v = 2$  m/s    $t = -20$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

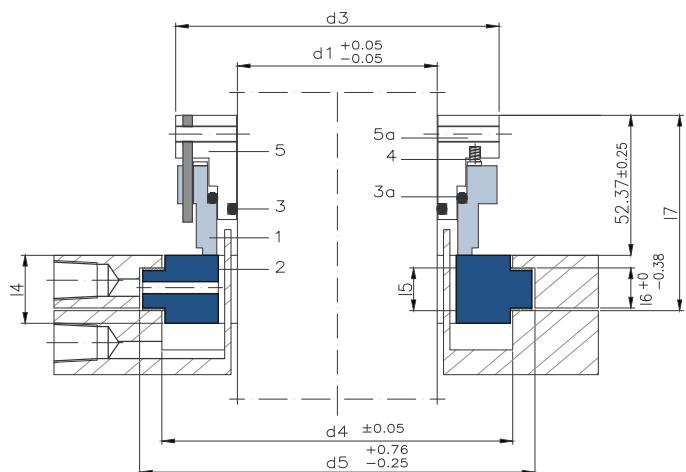

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**COMPONENTS:**

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 4 Springs
- 5 Metal frame
- 5a Set screws

**DESCRIPTION:**

It can be used in vertical agitators with moderate speeds without the need to apply auxiliary lubrication systems. Adapted to DEBRIS cleaning systems.

# AMS29

**SECTORS:**

**CHARACTERISTICS:**

- Balanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

**OPERATING LIMITS:**

$d_1 = 18$  to  $100$  mm    $p = 25$  kg/cm<sup>2</sup>

$v = 20$  m/s    $t = -15$  to  $+200^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

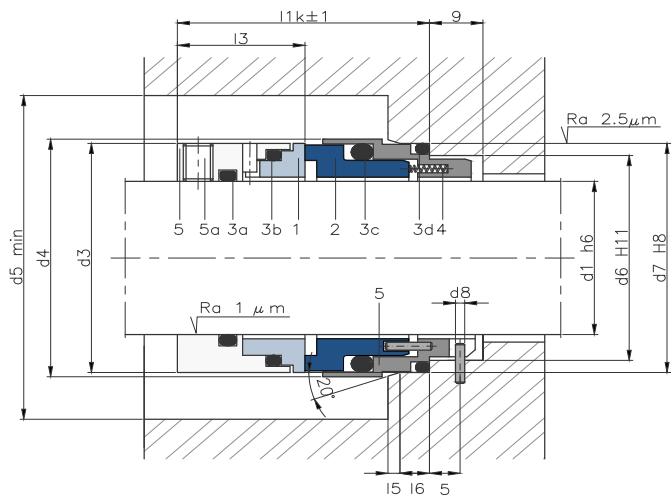

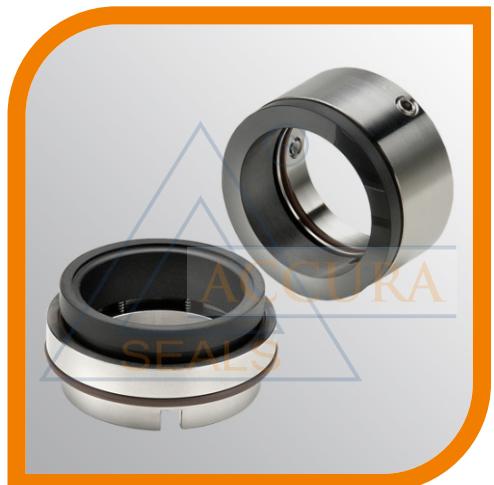

**DESCRIPTION:**

The fact that the springs are not in contact with the fluid makes this mechanical seal perfect for working with particle-laden fluids, as it prevents them from becoming blocked or obstructed.

Its structure and design makes it ideal for vacuum operations without having to use a retaining ring. It can be used with a single, tandem-mounted (API52) or back-to-back (API53) mounting system. The O-ring resting on the shaft is not affected by any axial movement (changes in pressure) and therefore produces no wear on the surface of the shaft. Seal compliant with standard EN 12756 (KU).

**COMPONENTS:**

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3a O-rings
- 3b O-rings
- 3c O-rings
- 3d O-rings
- 4 Springs
- 5 Metal frame
- 5a Set screws

# AWS10

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 14$  to  $150$  mm    $p = 10$  kg/cm<sup>2</sup>

$v = 20$  m/s    $t = -15$  to  $+200^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

Recommended for working with sticky fluids and fluids laden with particles and fibres. Unlike the multispring models, the wave spring model cannot be blocked or obstructed and its open leaf design produces a self-cleaning effect.

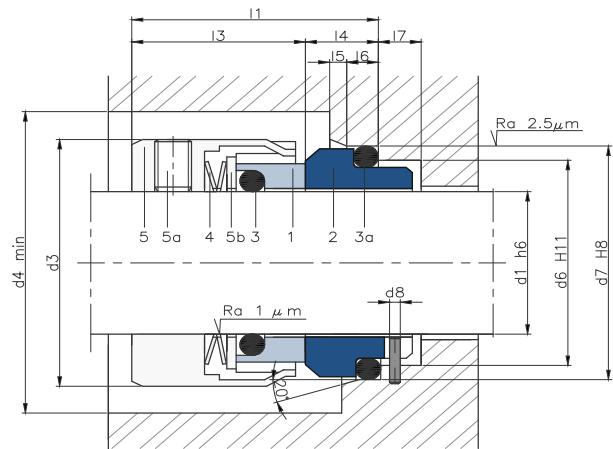

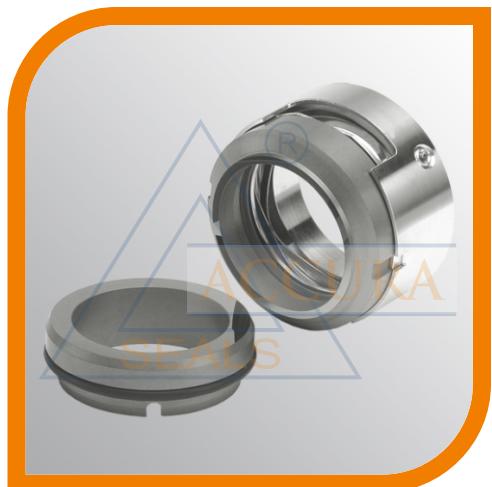

Standard L9 type stationary part.

Seal compliant with standard EN 12756 (KU).

Available with a pumping ring on the casing to reduce the temperature between the contact surfaces and facilitate the barrier fluid movement in the case of double mounting (AWS10-F).

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 4 Springs
- 5 Metal frame
- 5a Set screws
- 5b Ring

# AWS10B

**SECTORS:**

**CHARACTERISTICS:**

- Balanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

**OPERATING LIMITS:**

$d_1 = 14$  to  $100$  mm    $p = 25$  kg/cm<sup>2</sup>

$v = 20$  m/s    $t = -50$  to  $+220^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

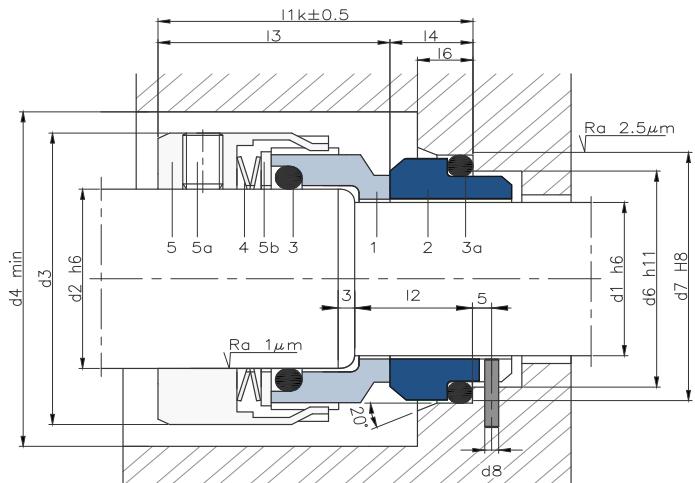

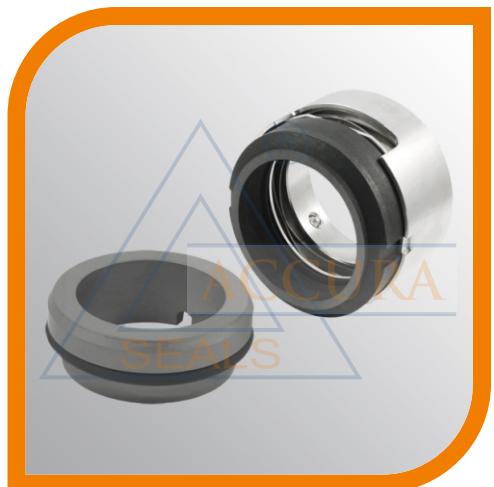

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

The balanced contact surface design allows the mechanical seal to be used in applications with high pressures without suffering premature wear. Recommended for working with sticky fluids and fluids laden with particles and fibres. Unlike the multispring models, the wave spring model cannot be blocked or obstructed and its open leaf design produces a self-cleaning effect. Standard A9 type fixed stationary part, standardised seal, compliant with EN 12756 (KB). The casing can incorporate a pumping ring to reduce the temperature between the contact surfaces and facilitate the barrier fluid movement in the case of double mounting (AWS10B-F).

- Not dependent on the rotation direction.

**OPERATING LIMITS:**

$d_1 = 20$  to  $100$  mm    $p = 10$  kg/cm<sup>2</sup>

$v = 20$  m/s    $t = -15$  to  $+200^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

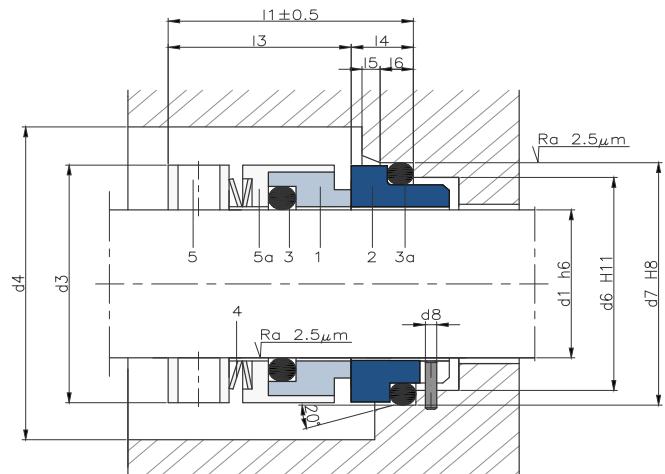

**COMPONENTS:**

- |    |                            |
|----|----------------------------|
| 1  | Rotating contact surface   |
| 2  | Stationary contact surface |
| 3  | O-rings                    |
| 3a | O-rings                    |
| 4  | Springs                    |
| 5  | Set screws                 |
| 5a | Metal frame                |

**DESCRIPTION:**

Its mounting dimensions make it a perfect seal for installing in small spaces. The wave spring is not blocked or obstructed when working with fluids laden with particles and fibers, or viscous fluids.

Standard L1 DIN stationary part.

# AWS30 / AWS30A

## SECTORS:

## CHARACTERISTICS:

- Balanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 18$  to  $100$  mm    $p = 35$  kg/cm<sup>2</sup>

$v = 20$  m/s    $t = -15$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

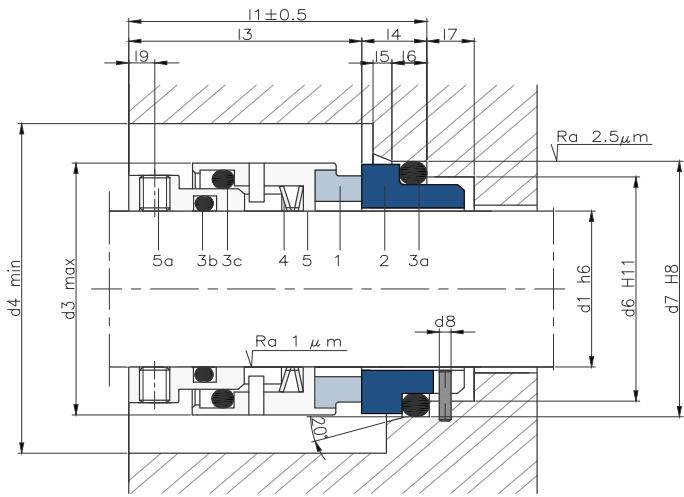

The wave spring is protected from the fluid. Ideal for using in cleaning processes since the possibility of particles adhering to the seal is considerably reduced. Internally balanced, with no need for a stepped shaft (AWS10B). Suitable for working in applications with high pressures. The O-ring resting on the shaft does not cause wear as there is no axial movement (changes in pressure).

Seal compliant with standard EN 12756 (KU).

Standard L16 type stationary part (AWS30).

## COMPONENTS:

- |    |                            |

**SECTORS:**

**CHARACTERISTICS:**

- Balanced.
- Shaft Fixing system Without screws.
- Independent Rotation System .

**OPERATING LIMITS:**

$d_1 = 20$  to  $35$  mm     $p = 35$  kg/cm<sup>2</sup>  
 $v = 20$  m/s                 $t = -40$  to  $+150^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

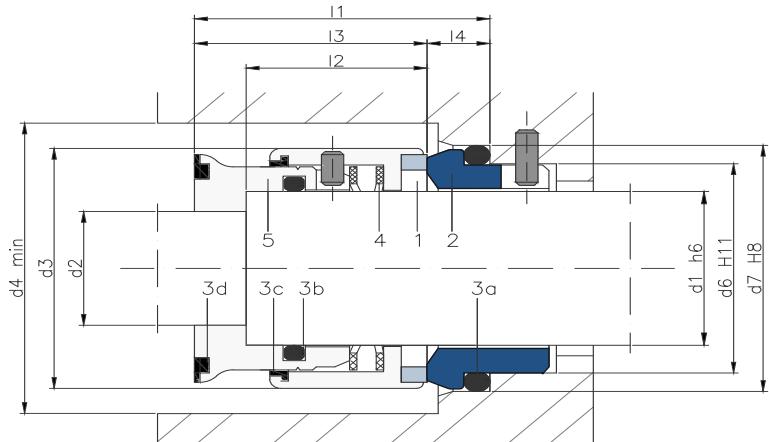

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

A wave spring mechanical seal in which the spring is isolated and protected from the product. Its hygienic design reduces the likelihood of traces of product being deposited on its surface, thereby eliminating the risk of contamination.

**COMPONENTS:**

- |    |                            |

# AWS70 / AWS71

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 15.8$  to  $100$  mm  $p = 10$  kg/cm<sup>2</sup>

$v = 15$  m/s  $t = -15$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

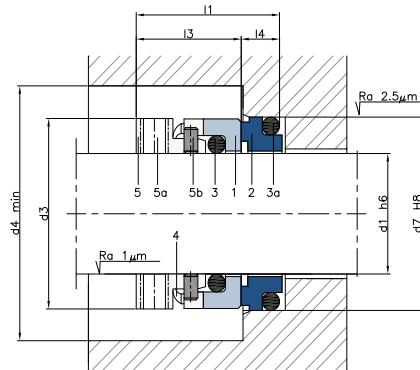

## DESCRIPTION:

This mechanical seal is designed for internal and external mounting. Its small mounting size makes it ideal for using in lobe pumps. The wave spring cannot be blocked or obstructed when working with fluids laden with particles, sticky or viscous fluids.

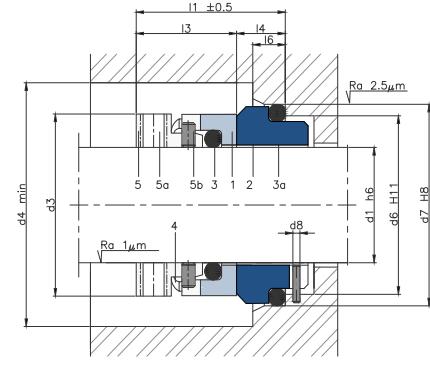

The fact that the rotating part of the mechanical seal is made of stainless steel (the most habitual combination) makes it a resistant, robust seal.

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 4 Springs
- 5 Metal frame
- 5a Set screws
- 5b Coupling pin

**SECTORS:****CHARACTERISTICS:**

- Unbalanced.
- Single conical spring.
- Dependent on the rotation direction
- Exchangeable Contact Surfaces.

**OPERATING LIMITS:**

$d_1 = 10$  to  $100$  mm    $p = 10$  kg/cm<sup>2</sup>

$v = 20$  m/s    $t = -20$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

A general-purpose single, robust seal in which the contact surfaces can be exchanged with each other. It can be used in industrial applications for clean fluids with low viscosities or with a low content of suspended solids that tend to produce sediments or adhere to the seal.

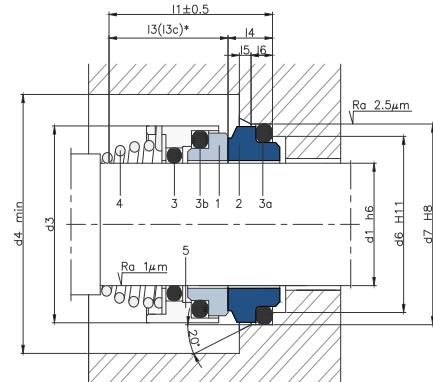

**Types:**

FH6: secondary seals made of PTFE.

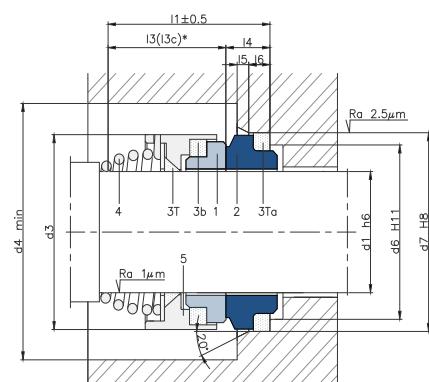

FHC: same structure as FH but the length is I3C.

**COMPONENTS:**

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 3b O-rings
- 3T PTFE wedge
- 3Ta PTFE gasket
- 4 Springs
- 5 Metal frame

# AS15 and AS15DIN

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- Single conical spring.
- Dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 10$  to  $40$  mm     $p = 10$  kg/cm<sup>2</sup>

$v = 20$  m/s     $t = -20$  to  $+180^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

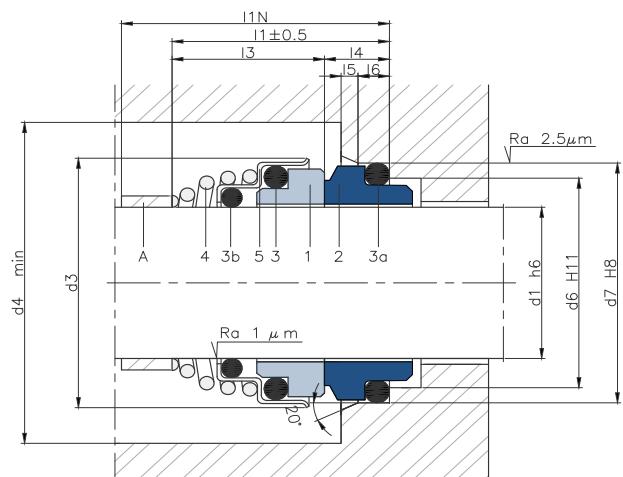

An all-purpose mechanical seal.

A single seal with a versatile design that can be used in applications with low demands: for pumping industrial wastewater and for household use.

Seal compliant with standard EN 12756 (NU).

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 3b O-rings
- 4 Springs
- 5 Metal frame
- A Spacer not provided with the seal

## DESCRIPTION:

Single mechanical seal with an extremely versatile and functional design. The rotating part of the seal can be combined with a large variety of stationary parts, which offers a wide range of combinations. Its structure allows secondary seals made of different materials to be used: FKM, Aflas®, FFKM, FEP, NBR, HNBR and materials complying with special standards such as FDA, USP, EC, etc.

Type AS18: Working length of rotating part  $l_3$ .  
Type AS19: Working length of rotating part  $l_{21}$ .

# AS18B

## SECTORS:

## CHARACTERISTICS:

- Balanced.
- Single conical spring
- Dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 10$  to  $80$  mm     $p = 25$  kg/cm<sup>2</sup>

$v = 15$  m/s     $t = -20$  to  $+200^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

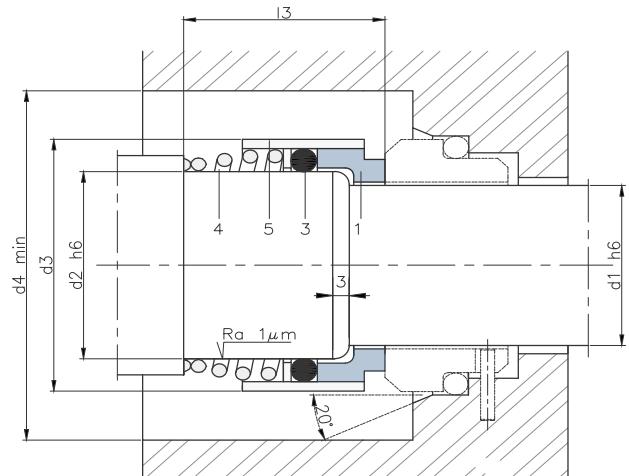

This mechanical seal has an extremely versatile and functional design and is suitable for working at pressures of up to 25 kg/cm<sup>2</sup>.

The rotating part of the seal can be combined with a large variety of stationary parts, which offers a wide range of combinations.

Its structure allows secondary seals made of different materials to be used: FKM, Aflas®, FFKM, FEP, NBR, HNBR and materials complying with special standards such as FDA, USP, EC 1935/2004, etc.

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 4 Springs
- 5 Metal frame

Dimensions subject to changes or modifications.

## SECTORS:

## CHARACTERISTICS:

- Balanced.
- System attached to the shaft by allen screws.
- Not dependent on the rotation direction.

## OPERATING LIMITS:

 $d_1 = 10$  to  $140$  mm    $p = 10$  kg/cm<sup>2</sup> $v = 20$  m/s    $t = -20$  to  $+200^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

A versatile, robust single seal that is widely used in many different industrial and household applications. The rotating part, with a compact design, only permits the use of secondary seals made of elastic materials. If it should be necessary to use secondary seals made of PTFE for reasons related to temperature, the AS61 model is recommended.

## Types:

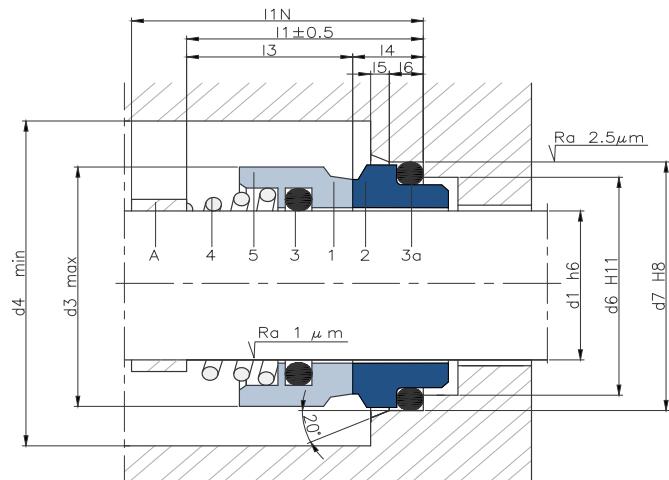

AS61 and AS61 DIN: Secondary seals made of PTFE and contact surfaces in GB.

AS60DIN: standardised models in accordance with EN 12756 NU.

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 4 Springs
- 5 Metal frame
- A Spacer not provided with the seal

Dimensions subject to changes or modifications.

**SECTORS:****CHARACTERISTICS:**

- Balanced.
- Single conical spring
- Dependent on the rotation direction.

**OPERATING LIMITS:**

$d_1 = 10$  to  $100$  mm    $p = 50$  kg/cm<sup>2</sup>

$v = 20$  m/s    $t = -20$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

A versatile, robust single seal that is widely used in many different industrial and household applications.

Suitable for working at high pressures.

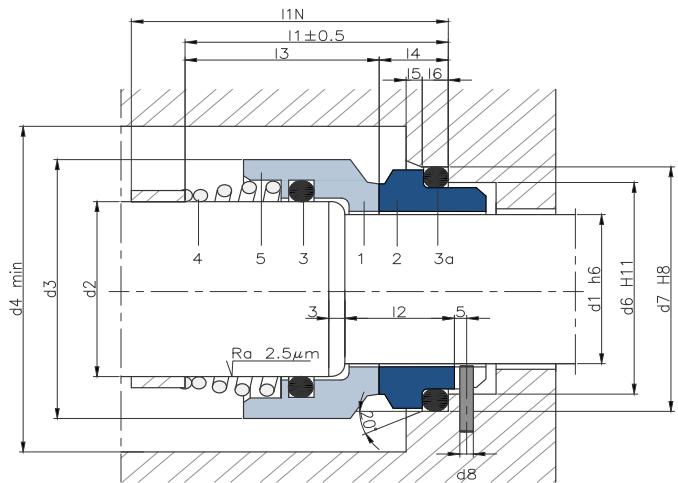

The rotating part, with a compact design, only permits the use of secondary seals made of elastic materials.

**Types:**

AS60BDIN: standardised models in accordance with EN 12756 NB.

**COMPONENTS:**

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 4 Springs
- 5 Metal frame

# AS40A

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- Single cylindrical spring.
- Dependent on the rotation direction.
- System attached to the shaft by allen screws.

## OPERATING LIMITS:

$d_1 = 20$  to  $100$  mm    $p = 12$  kg/cm<sup>2</sup>

$v = 15$  m/s    $t = -20$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## COMPONENTS:

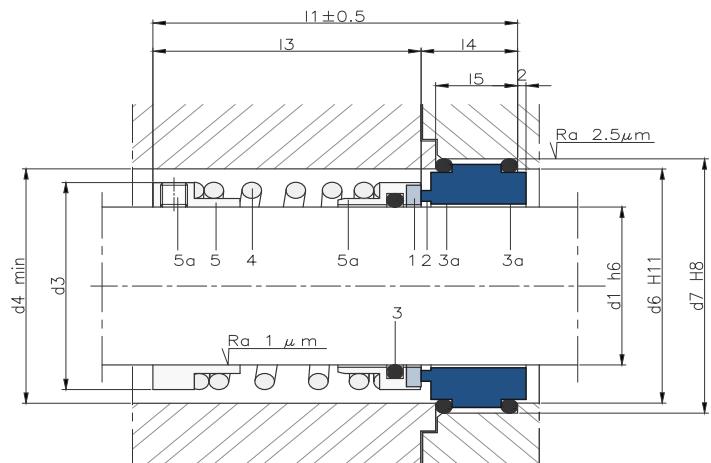

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 4 Springs
- 5 Metal frame
- 5a Set screws

## DESCRIPTION:

Single mechanical seal with an extremely versatile and functional design.

The fact that it is attached to the shaft with screws allows this seal to be installed in a large variety of applications with differing mounting dimensions. Its structure allows secondary seals made of different materials to be used: FKM, Aflas®, FFKM, FEP, NBR, HNBR and materials complying with special standards such as FDA, USP, EC, etc.

# AMB84

## SECTORS:

## CHARACTERISTICS:

- Balanced.
- Spiral-wound metal bellows.
- Not dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 18$  to  $100$  mm    $p = 20$  kg/cm<sup>2</sup>

$v = 25$  m/s    $t = -40$  to  $+200^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

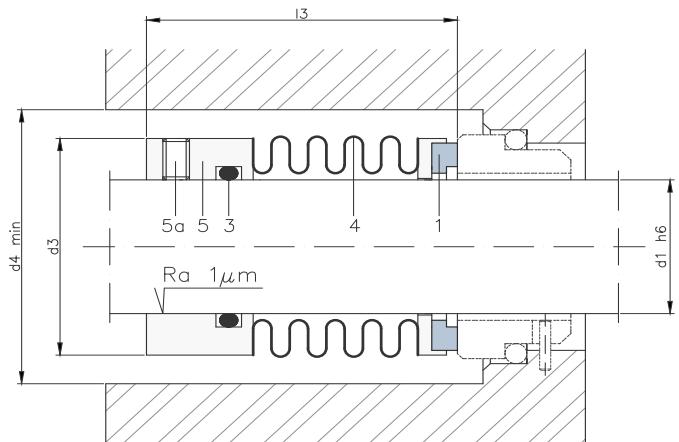

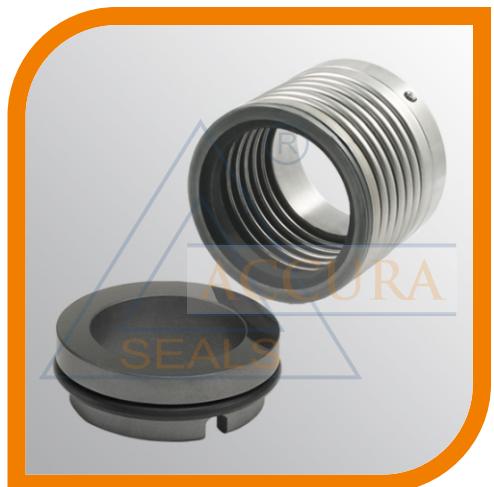

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

Balanced by the bellows, without the need for a stepped shaft (models AWS10B, AMS20B). Suitable for working in applications with high pressures. The O-ring resting on the shaft does not cause wear as there is no axial movement (changes in pressure). Recommended for working with sticky or viscous fluids that require cleaning processes (CIP) or sterilisation processes (SIP) in situ due to the geometry of the spiral-wound bellows.

## COMPONENTS:

- 1 Rotating contact surface
- 3 O-rings
- 4 Metal bellows
- 5 Set screws
- 6 Metal frame

# AMB85

## SECTORS:

## CHARACTERISTICS:

- Balanced.
- Welded metal bellows.
- Not dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 16$  to  $100$  mm    $p = 20$  kg/cm<sup>2</sup>

$v = 25$  m/s    $t = -40$  to  $+200^\circ\text{C}$  (\*)  
 $-40$  to  $+200^\circ\text{C}$  (up to  
 $400^\circ\text{C}$  with a special  
design) (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

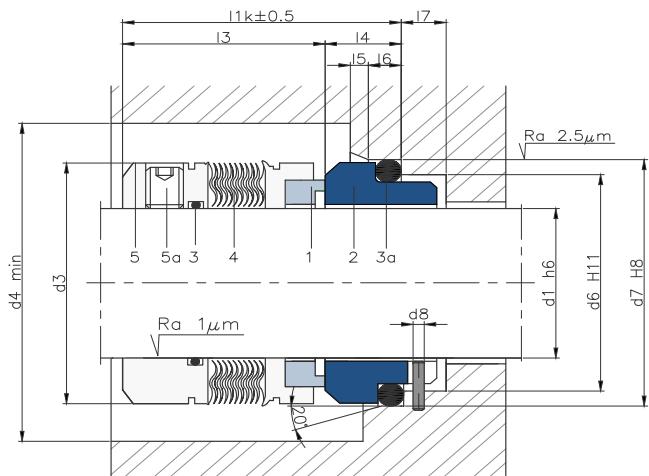

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

Internally balanced, with no need for a stepped shaft (models AWS10B, AMS20B). The O-ring resting on the shaft does not cause wear as there is no axial movement. Appropriate for applications with sticky or high viscosity fluids as its open leaf design generates a self-cleaning effect. In addition it is suitable for application at moderate pressures and high temperatures (for up to  $400^\circ\text{C}$  please enquire) and very aggressive fluids in chemical and mechanical terms. Very often used in compressors.

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 O-rings
- 3a O-rings
- 4 Metal bellows
- 5 Metal frame
- 5a Set screws

# AMB86

**SECTORS:**

**CHARACTERISTICS:**

- Balanced.
- Graphite wedge
- Welded metal bellows.
- Not dependent on the rotation direction.

**OPERATING LIMITS:**

$d_1 = 25$  to  $100$  mm    $p = 20$  kg/cm<sup>2</sup>

$v = 25$  m/s    $t = -75$  to  $+425^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

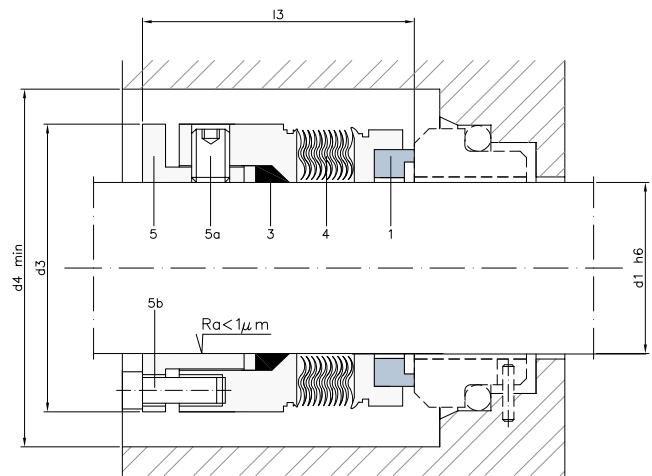

Internally balanced, with no need for a stepped shaft (models AWS10B, AMS20B). The graphite wedge allows applications at very high temperatures.

Appropriate for applications with sticky or high viscosity fluids as its open leaf design generates a self-cleaning effect.

In addition it is suitable for application at moderate pressures as well as with very aggressive fluids, both chemically and mechanically terms. Very often used in compressors.

# ARB01-ARB01S-ARB04-ARB04A and ARB06

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- Not dependent on the rotation direction
- Single cylindrical spring.

## OPERATING LIMITS:

$d_1 = 9.52$  to  $101.60\text{mm}$   $p = 10 \text{ kg/cm}^2$

$v = 10 \text{ m/s}$   $t = -15$  to  $+200^\circ\text{C} (*)$

(\*) The temperature resistance depends on the material of the secondary seals used.

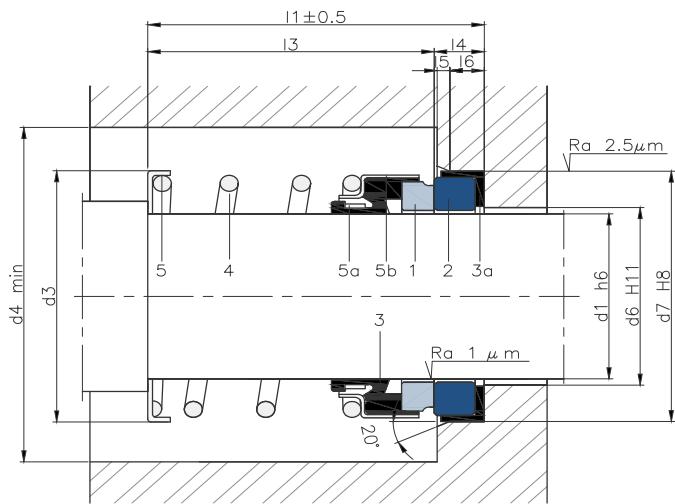

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

Mechanical seal with a simple design for general use. Type ARB04/ ARB04A are standardised models in accordance with EN 12756 (KU).

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 Bellows
- 3a Elastomeric cup
- 4 Springs
- 5 Ring
- 5a Drive ring
- 5b Metal frame

# ARB02

**SECTORS:**

**CHARACTERISTICS:**

- Unbalanced.
- Not dependent on the rotation direction
- Single cylindrical spring.

**OPERATING LIMITS:**

$d_1 = 9.52$  to  $25.40$  mm  $p = 7$  kg/cm<sup>2</sup>

$v = 10$  m/s  $t = -15$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

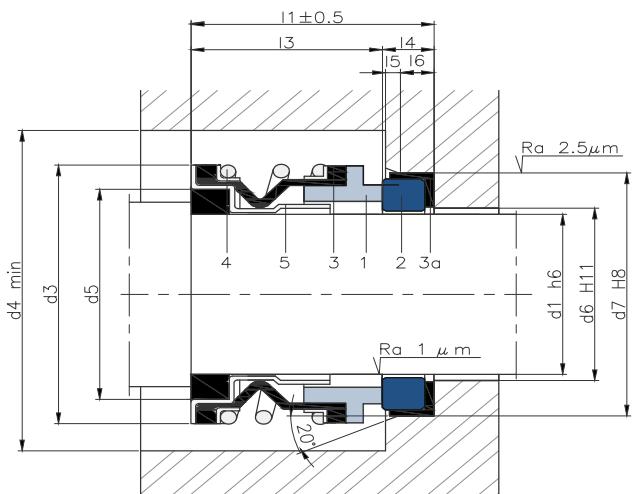

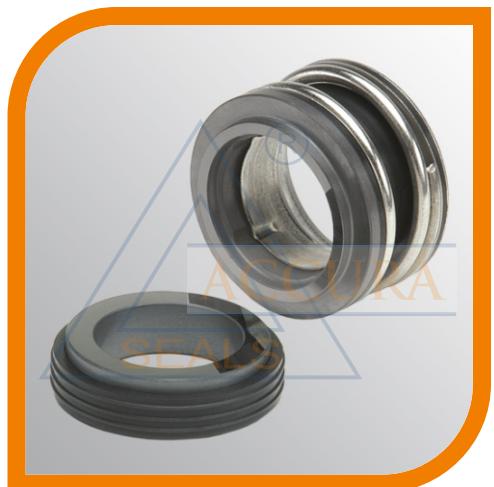

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

Seal with a compact design for applications with low demands that require small diameters and often used for water pumps.

**COMPONENTS:**

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 Bellows
- 3a Elastomeric cup
- 4 Spring
- 5 Metal frame

# ARB03 - ARB03A - ARB03B

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- Not dependent on the rotation direction
- Single cylindrical spring.

## OPERATING LIMITS:

$d_1 = 10 - 30 \text{ mm}$     $p = 6 \text{ kg/cm}^2$

$v = 10 \text{ m/s}$     $t = -20 - +100^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

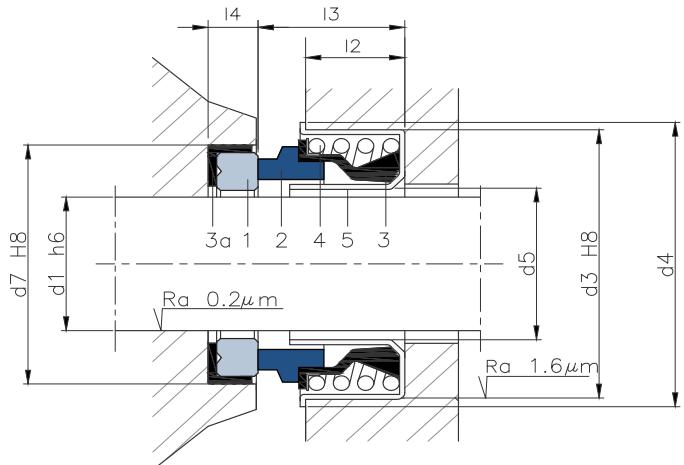

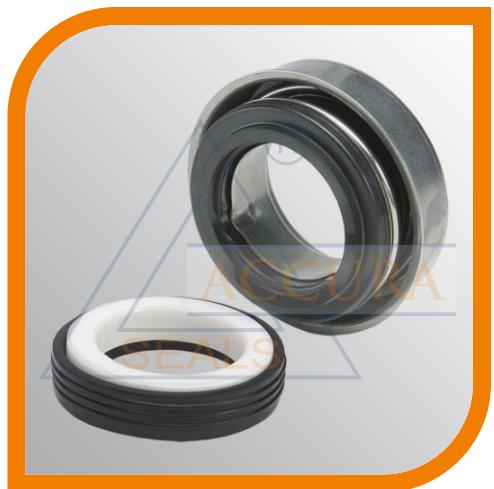

## DESCRIPTION:

Mechanical seal with a compact design and small dimensions which is ideal for simple hydromassage or drinking water pumps.

The rotating part is attached to the pump impeller, rotates together with it. The stationary part is secured to the housing on its external diameter.

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 Bellows
- 3a Elastomeric cup
- 4 Spring
- 5 Metal frame

# ARB17 - ARB17A - ARB17E - ARB17KU - ARB17NU

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- Not dependent on the rotation direction
- Single cylindrical spring.

## OPERATING LIMITS:

$d_1 = 10$  to  $100\text{mm}$   $p = 12\text{ kg/cm}^2$

$v = 10\text{ m/s}$   $t = -15$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

A versatile, robust single seal that is widely used in many different industrial and household applications. The different type ARB 17 varieties can be combined with a wide range of stationary parts, thereby increasing its versatility due to the combination of different materials and working lengths.

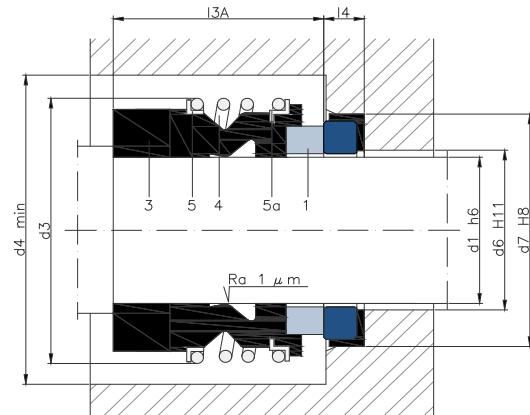

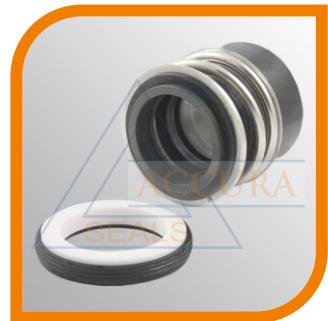

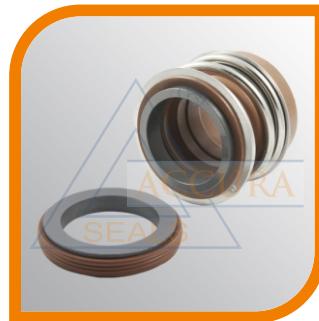

### Types:

ARB17KU-L6 / ARB17KU-L60: standardised dimensions in accordance with standard EN 12756 (KU).

ARB17NU-L6 / ARB17NU-L60 : standardised dimensions in accordance with standard EN 12756(NU).

## COMPONENTS:

Tolerances l<sub>1</sub> d<sub>1</sub> 10...12 mm ± 0.5; 14...18 mm ± 1.0; 20...25 mm ± 1.5; 28...100 mm ± 2.0

# ARB25-R - ARB25KU-R and ARB25NU-R

## SECTORS:

## CHARACTERISTICS:

- Balanced.
- Not dependent on the rotation direction
- Single cylindrical spring.

## OPERATING LIMITS:

$d_1 = 10$  to  $100$  mm    $p = 20$  kg/cm<sup>2</sup>

$v = 15$  m/s    $t = -15$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

An extremely versatile general-use mechanical seal. It has metal tabs that reduce fatigue and tension in the rubber bellow when in the working position.

A balanced seal without the need for a stepped shaft.

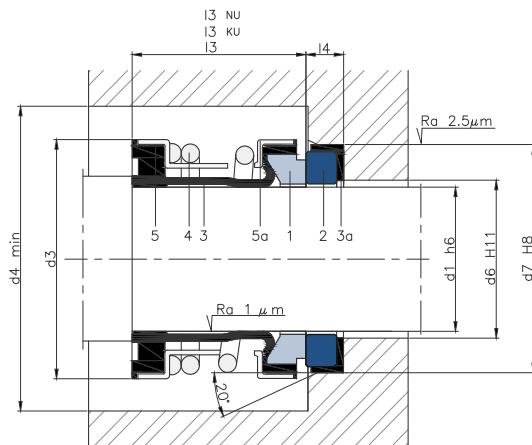

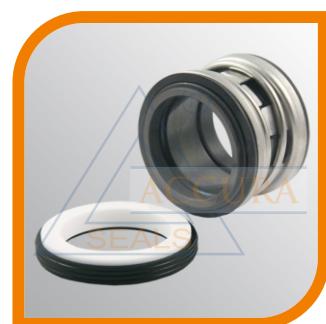

The seal can operate in applications with high pressures without suffering premature wear.

## Types:

ARB25KU-R and ARB25NU-R: standardised dimensions in accordance with standard EN 12756 (KU and NU respectively).

## COMPONENTS:

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 Bellows
- 3a Elastomeric cup
- 4 Springs
- 5 Ring
- 5a Metal frame

## AR / ARB31

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- Not dependent on the rotation direction
- Single cylindrical spring.

## OPERATING LIMITS:

$d_1 = 6$  to  $70$  mm       $p = 6$  kg/cm<sup>2</sup>  
 $v = 10$  m/s       $t = -20$  to  $+140^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

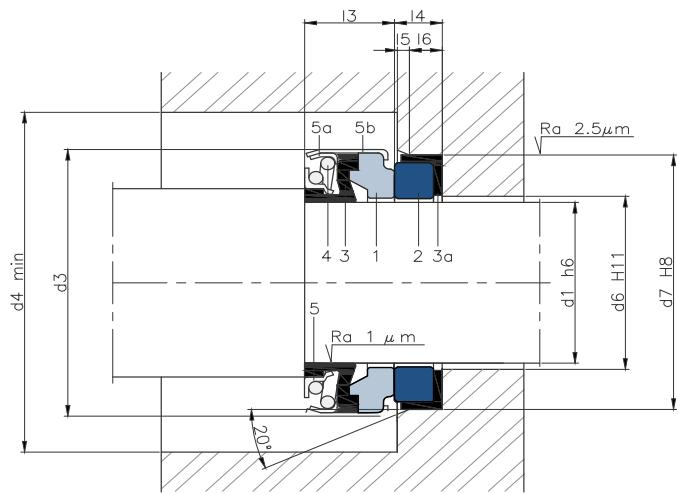

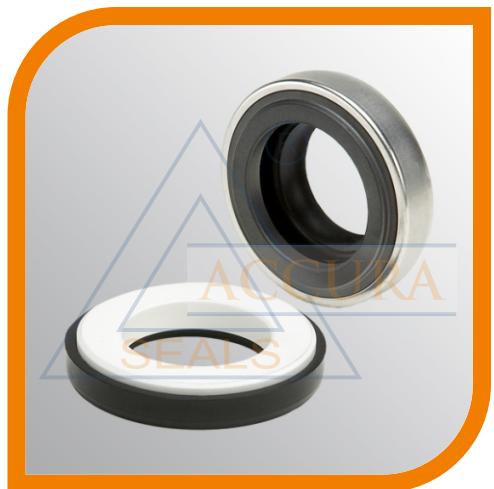

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

Economic mechanical seal with small dimensions, used in large household pump productions for recirculating water or for working conditions with low demands.

## COMPONENTS:

- |    |                            |
|----|----------------------------|
| 1  | Rotating contact surface   |
| 2  | Stationary contact surface |
| 3  | Bellows                    |

# ARB50

**SECTORS:**

**CHARACTERISTICS:**

- Balanced.
- Not dependent on the rotation direction
- Single cylindrical spring.

**OPERATING LIMITS:**

$d_1 = 14$  to  $100$  mm    $p = 20\text{kg/cm}^2$

$v = 15 \text{ m/s}$     $t = -15$  to  $+200^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

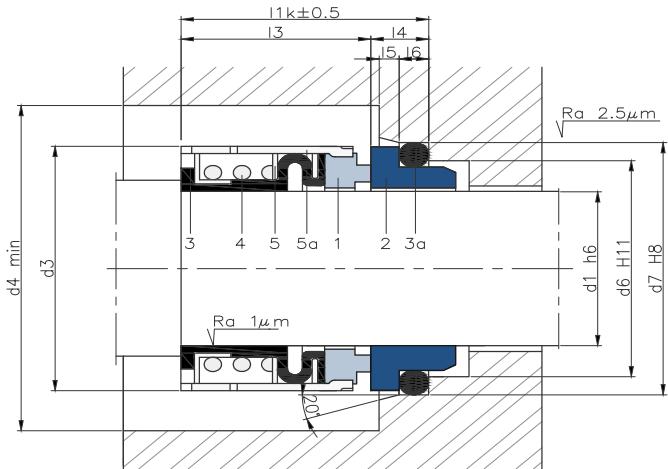

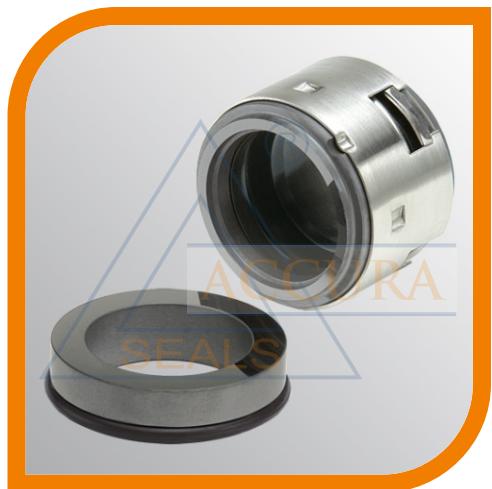

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

A balanced seal without the need for a stepped shaft. The casing of the rotating part protects the bellows from abrasion and from the rotation transmission tensions, and the spring from blocking in the event of being contaminated by fibers and particles. It is recommended for use with highly viscous or sticky fluids containing fibers or particles, or with fluids that produce a chemical attack on the shaft.

**COMPONENTS:**

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 Bellows
- 3a O-ring
- 4 Spring
- 5 Ring
- 5a Metal frame

# ATB16

**SECTORS:**

**CHARACTERISTICS:**

- Unbalanced.
- Not dependent on the rotation direction.
- External mounting.

**OPERATING LIMITS:**

$d_1=25$  to  $100$  mm    $p=12\text{kg}/\text{cm}^2$

$v=16\text{ m/s}$     $t=-40$  to  $+200^\circ\text{C}$  (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

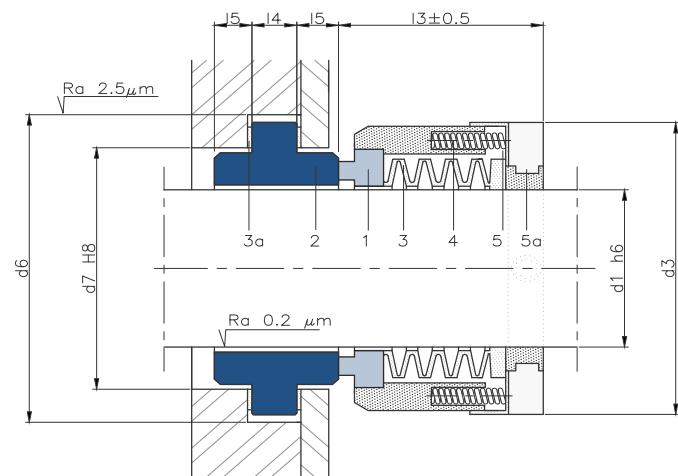

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

**DESCRIPTION:**

This mechanical seal model is mostly made of PTFE and other materials that are resistant to chemically aggressive products. The metal parts are isolated from the process fluid.

**COMPONENTS:**

- 1 Rotating contact surface
- 2 Stationary contact surface
- 3 Bellows
- 3a PTFE gasket
- 4 Spring
- 5 Ring
- 5a Set screw

# PNL

## SECTORS:

## CHARACTERISTICS:

- Unbalanced.
- Single Cylindrical Spring
- Not dependent on the rotation direction.

## OPERATING LIMITS:

$d_1 = 8$  to  $40$  mm       $p = 12\text{kg}/\text{cm}^2$   
 $v = 10$  m/s       $t = -20$  to  $+120^\circ\text{C}$ (\*)

(\*) The temperature resistance depends on the material of the secondary seals used.

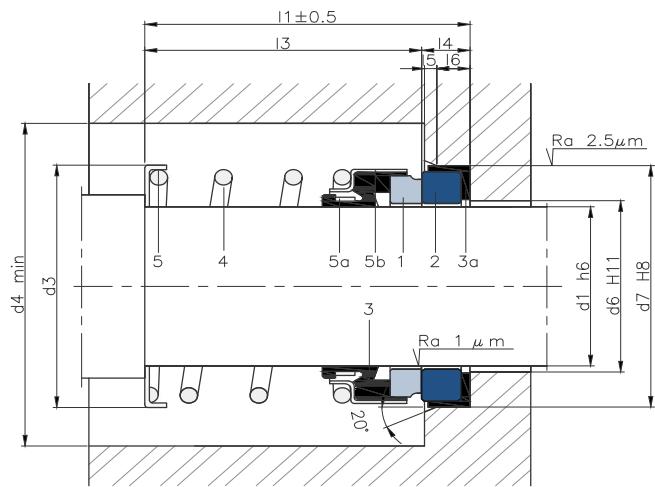

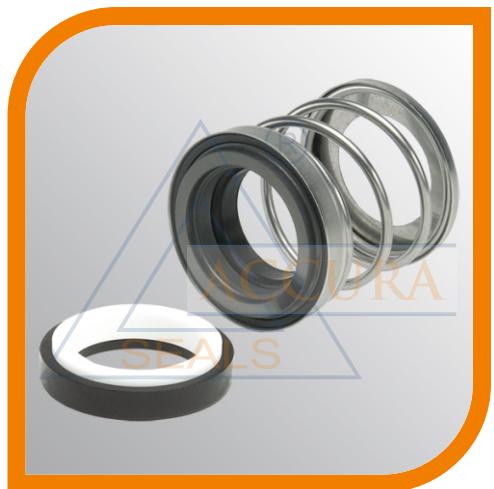

The operating limits are defined by the PV factor which is determined for the sealing system characteristics and those of the application.

## DESCRIPTION:

Mechanical seal with a simple design for general use.

## COMPONENTS:

- |    |                            |
|----|----------------------------|
| 1  | Rotating contact surface   |
| 2  | Stationary contact surface |
| 3  | Bellows                    |
| 3a | Elastomeric Cup            |
| 4  | Spring                     |
| 5  | Ring                       |
| 5a | Drive ring                 |
| 5b | Metal frame                |

## REPAIR WORKSHOP, QUALITY CONTROL

## Repair workshop

Accura's modern, adequate equipment enables it to execute repair and transformation operations on mechanical seals and cartridges.

The process commences by diagnosing the condition of the part, and after this, we execute the necessary processes for cleaning, polishing and lapping the contact surfaces, grinding parts and replacing components, etc.

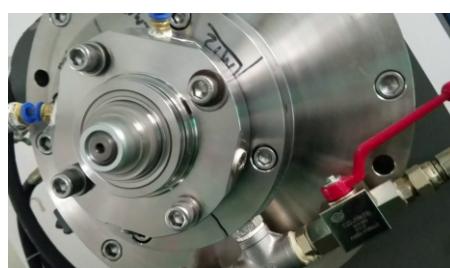

After carrying out these operations, the sealing of the repaired parts is checked by pressure test, to ensure that the part is ready for operation in any application that requires sealing of the highest standard.

We also offer additional services such as a diagnostic report on the sample received and a detailed analysis of the faults observed or laser marking of parts to facilitate their identification and traceability.

## Quality control, checking and testing

All the mechanical seals manufactured or repaired by Accura are subject to the strictest quality controls. We guarantee their operation in the most demanding applications.

Furthermore, if the customer wishes, we can provide other services such as sealing controls in static or dynamic conditions and at different pressures before delivering the product. Working along this line we perform static sealing controls on all our cartridges before delivering them to the customer.

## GENERAL INFORMATION

## Certifications:

## GENERAL INFORMATION

### Selecting the mechanical seals

The following information should be taken as a general reference and for preliminary guidance purposes in selecting the mechanical seals. For technical or economic reasons, other types of mechanical seals can be provided, made of different materials from those described here. For a selection that is more precise and in keeping with the special requirements of each application and each customer, please contact your ACCURA sales team.

The selection of the mechanical seal configuration, depending on the fluid and the working conditions, is set out in the "Sectors" section.

When selecting the materials of the mechanical seal, the following criteria can be followed:

#### • Contact surfaces:

The materials used for the contact surfaces are classified as "hard" and "soft". The "hard" ones include steel, carbide, oxide and ceramic. "Soft" materials include carbon and PTFE. As a general rule, combinations with one surface made of a hard material and the other of a soft material or both surfaces of a hard material are used.

#### - "Soft"- "hard" material combinations:

Whenever possible, it is best to use a combination of hard-soft materials as this has a series of advantages in comparison with a combination of hard materials. The most common are:

- **BV, BX → Economic combination:** normally used in applications involving running water. It is not suitable for dry operation, and in operations with little lubrication or with sudden changes in temperature. Ceramic has very low thermal conductivity and, since it undergoes enormous increases in temperature, it may cause fractures due to thermal shock.

- **BF, BG → "Soft" combination:** stainless steel, despite being considered "hard", may be marked and damaged by contaminant particles found in working fluids. The friction coefficient is not optimum but the material has an excellent capacity to conduct and evacuate the heat generated. In addition, the steel surface has great tenacity in the face of oscillation or knocks which could occur during assembly and while the application is in operation.

- **BQ, BU → "Hard" combination:** it has a good friction coefficient and is suitable for difficult working conditions.

- **AQ, AU → Combination for high temperatures:** antimony-impregnated carbon is suitable for working in conditions without solids in suspension of up to 350° C.

#### - "Hard"- "hard" material combinations:

When working with fluids containing particles in suspension, fluids which can chemically attack carbon impregnation or which require a durable assembly, it is best to use a combination of hard materials. The most common are:

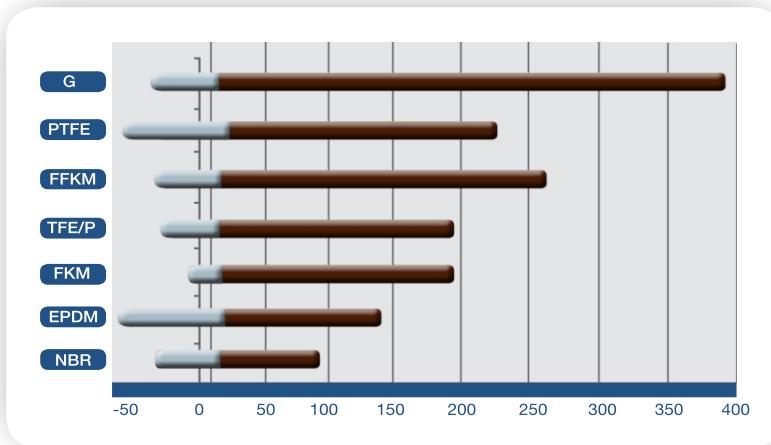

- **QQ → Silicon-Silicon:** This is the hard combination most often used. It has greater chemical resistance and the best friction coefficient of all the hard combinations. However, it is also the most fragile material and has the greatest risk of being damaged during assembly. Different silicon carbide grades can be used to obtain special performances in the surfaces (Q<sub>1</sub>, Q<sub>6</sub>).

- **UU → Tungsten-Tungsten:** This is the most resistant option in mechanically aggressive working conditions. It has good resistance to impact, to vibrations, and to a large variety of chemicals. It is usually more expensive than silicon. Its friction coefficient is greater and so it is advisable to ensure good lubrication. This combination is widely used in wastewater and fluids loaded with particles such as sand or silt.

### Secondary seals

The material used for the secondary seals is selected based on two criteria: the working temperature and the potential chemical attack of the working fluid.

With respect to the working temperature, the following graph is given as a guide:

NBR is the most economical material and the one with the lowest useful working temperature range and graphite is the most suitable material for working at high temperatures. Within the elastomer group, FFKM is the material that is most resistant to temperature, allowing temperatures of 320° C to be reached in some special compounds, on demand.

**GENERAL INFORMATION**

# Materials Codes

**Contact surfaces (position 1 and 2)****SYNTHETIC CARBONS**

- A: Antimony-impregnated carbon
- B: Resin-impregnated carbon
- B<sub>2</sub>: Resin-impregnated carbon
- B<sub>3</sub>: Pure non-impregnated carbon
- B<sub>5</sub>: Hot pressed carbon

**METALS**

- E: Chromium steel; AISI 420 (1.4021 ; 1.4028)
- F<sub>1</sub>: Nickel-chromium steel; AISI 431 (1.4057)
- G: Nickel-chromium-molybdenum steel; AISI 316 (1.4401)
- D: Duplex stainless steel (1.4462 ; 1.4162)
- Z: Nickel-chromium-molybdenum steatite steel
- C: Brass

**CARBIDES**

- U: Tungsten carbide with welded / inserted nickel
- U<sub>1</sub>: Solid tungsten carbide with nickel
- Q<sub>1</sub>: Sintered silicon carbide with no free silicon
- Q<sub>2</sub>: Sintered silicon carbide
- Q<sub>6</sub>: Sintered silicon carbide with carbon

**CERAMIC MATERIALS**

- V: Alumina oxide 99,5%
- V<sub>2</sub>: Alumina oxide 95%
- X: Steatite

**SYNTHETIC MATERIALS**

- Y: Glass-filled PTFE
- Y<sub>1</sub>: PTFE-graphite

**Secondary seals (position 3)****ELASTOMERS**

- P: Nitrile butadiene rubber (NBR)
- H: Hydrogenated nitrile butadiene rubber (HNBR).
- N: Chloroprene rubber (CR)
- E: Ethylene-propylene diene monomer (EPDM)
- X: Ethylene-propylene diene monomer peroxide (EPDMPX)
- S: Methyl-vinyl silicon rubber (MVQ)
- V: Fluorocarbon (FKM or Viton® Rubber)
- K: Perfluorocarbon rubber (FFKM)
- M: Viton® Rubber coated with PTFE (FEP-FKM / FEP-MVQ)
- A: Tetrafluoro-ethylene Propylene Rubber (TFE/P or Aflas®)

**NON-ELASTOMERS**

- G: Graphite
- T: PTFE

**Springs and other metal parts (position 4 and 5)**

- E: Chromium steel; AISI 420 (1.4021; 1.4028)
- F: Nickel-chromium steel; AISI 304 (1.4301)
- F<sub>1</sub>: Nickel-chromium steel; AISI 431 (1.4057)
- G: Nickel-chromium-molybdenum steel; AISI 316 (1.4401)
- G<sub>2</sub>: AM350 nickel-chromium-molybdenum steel. AM350.
- L: Nickel-chromium-molybdenum steel; AISI 316L (1.4404)
- D: Nickel-chromium-molybdenum duplex stainless steel (1.4462)
- M: Hastelloy® C276
- M<sub>2</sub>: Inconel® 718
- M<sub>4</sub>: Monel®400
- B: Brass
- G<sub>3</sub>: Alloy® 20
- G<sub>4</sub>: 316 Ti (1.4571)

**Synthetic carbons**

Synthetic carbons are the materials most often used due to their intrinsic characteristics: they are self-lubricating, economical and have good chemical resistance. There are several types:

**Code A: Antimony-impregnated carbon.**

It has less chemical resistance than resin-impregnated carbon but is used due to its resistance to high temperatures (350°C). It is recommended for high pressure applications with hydrocarbons, thermal oils or gases.

**Code B: Resin-impregnated carbon.**

The most standard and economical. It can withstand temperatures of up to 180°C.

**Code B<sub>2</sub>: Resin-impregnated carbon.**

A mechanised carbon with a more compact internal structure which gives it greater chemical resistance than type B graphite.

**Code B<sub>3</sub>: Non-impregnated carbon.**

A carbon with no resin or metal content with a very high resistance to temperature (3000° C) and chemicals.

**Ceramic materials**

Ceramic materials have extremely high purity, are very resistant to wear and have high chemical resistance. However, they become fragile in the presence of sudden changes in temperature (thermal shock).

**• Code X: Stéatite.**

Its composition is silica oxide (SiO<sub>2</sub>) 52%, magnesium oxide (MgO) 23%, alumina oxide (Al<sub>2</sub>O<sub>3</sub>) 5.1%. It is ochre in colour and used in clean water applications. An economical material. Has low chemical resistance and low thermal conductivity, for which reason it does not dissipate heat well. Low resistance to thermal shock.

**• Code V: Alumina oxide with a purity of 99.5%.**

It is chemically inert and has excellent resistance to wear. Due to its purity, it can withstand a higher degree of thermal shock than other types of ceramic. It is recommended in clean water operations, in combination with graphite (B).

Low thermal conductivity and poor heat dissipation. Low resistance to thermal shock.

## GENERAL INFORMATION

### Metal carbides

Metal carbides are extremely hard materials manufactured by sintering. They have high chemical and wear resistance and are used in environments with solids or particles which can attack soft materials such as carbon.

- **Code U: Inserted / welded tungsten carbide.**

An extremely hard and tenacious material. It is appropriate for applications with a pH of more than 6 (in the case of welded parts).

Good behaviour with respect to wear under severe conditions. Good thermal conductivity. High elastic modulus, meaning it is not likely to become deformed, especially in high pressure applications. Limited chemical resistance, especially to acid products. A very high density material, which can be critical in high speed rotating operations.

Limited capacity to withstand dry operation conditions or extremely limited lubrication conditions, especially when working with the same material.

- **Códe U<sub>1</sub>: Solid tungsten carbide with nickel.**

An extremely hard and tenacious material. Limited chemical resistance, especially to acid products. Suitable for applications with pH values above 2. Good behaviour with respect to wear under severe conditions. Good thermal conductivity. High elastic modulus, meaning it is not likely to become deformed in comparison with metal materials. A very high density material, which can be critical in high speed rotating operations.

Limited capacity to withstand dry operation conditions or extremely limited lubrication conditions, especially when working with the same material.

- **Code Q: Silicon carbide.**

Good resistance to wear and to friction in heavy duty work. It is the perfect material for working in contact with abrasive and corrosive fluids, and at high pressures. Its main characteristics are as follows:

- High thermal conductivity, comparable to tungsten carbide.
- Low resistance to thermal shock.
- High elasticity modulus.
- Good chemical resistance.
- Lower density than tungsten carbide.

May be subject to chemical attack by certain strong alkaline products. For that reason it is important to choose the most appropriate silicon carbide grade:

Q<sub>1</sub>: Contains no free silicon. It has the best chemical resistance of all carbides, but low tenacity. Its friction characteristics are poorer than grade Q<sub>2</sub>, but higher than those of tungsten carbide.

Q<sub>2</sub>: Contains free silicon. It has the best friction characteristics of all silicon carbides. Some acid or alkaline substances may cause lixiviation in free silicon but in general, it is more inert than tungsten carbide.

Q<sub>6</sub>: Has a silicon and graphite carbide base. This mixture combines the high resistance to wear of silicon carbide and the lubricant properties of graphite.

Silicon carbide normally runs against resin-impregnated graphite (B), but metal carbons may also be used for high performance (hot water applications). The silicon carbide and carbon combination is frequently used, providing long life in a wide range of conditions due to its excellent resistance to thermal shock.

In applications with abrasives, it is advisable to use silicon carbide against tungsten carbide, which is the most effective combination due to its resistance to wear and friction.

Silicon carbide may work against itself in very abrasive conditions but the friction characteristics are not as good as silicon carbide against tungsten carbide.

When silicon carbide is used against itself, the best results are obtained using different types, for instance Q<sub>1</sub> against Q<sub>2</sub> or Q<sub>2</sub> against Q<sub>6</sub>.

When hard material is worked against hard, the limited conditions of the application may give rise to sudden changes in surface temperature and dry operation. Although this occurs with a short space of time, it is best to use silicon carbide with graphite-impregnated silicon carbide (Q<sub>6</sub>). Due to its graphite content, this combination is resistant to the absence of lubrication for a limited time.

### Metals

- **Code E: AISI 420 chromium steel.** This is tempered stainless steel with a surface hardness of less than 50 HRc. It is used with fluids such as water or oils.

- **Code F: Nickel-chromium steel AISI 304.** Stainless steel used to manufacture springs and auxiliary parts.

- **Code F<sub>1</sub>: Nickel-chromium steel.** Stainless steel with good chemical resistance, used for fluids such as water, oils, chemicals, etc.

- **Code G: AISI 316 nickel-chromium-molybdenum steel.** Stainless steel with very good chemical resistance used with water, oils, hydrocarbons and chemicals.

- **Code G<sub>2</sub>: AM350 nickel-chromium-molybdenum steel.** Specifically for metal bellows that must work at high temperatures up to +300°C.

- **Code L: Nickel-chromium-molybdenum steel; AISI 316L.** Stainless steel with excellent chemical resistance. It provides a homogeneous surface with no pores and is recommended for hygienic applications.

- **Code Z: Nickel-chromium-molybdenum stellite steel.** To obtain it, the steel surface is treated with plasma, leaving a thickness of 0.2 to 0.3 mm. with considerable surface hardness and increased resistance to wear.

- **Code D: Nickel-molybdenum duplex stainless steel,** used for highly corrosive environments: marine, industrial, etc.

- **Code M: Hastelloy® C276.** A nickel, chromium and molybdenum alloy with great mechanical resistance and excellent chemical resistance for general use. It is used to make springs or auxiliary parts.

## GENERAL INFORMATION

- **Code M<sub>2</sub>: Inconel®718.** A nickel (53%), chromium (18%), tantalum-niobium (5%) and molybdenum (3%) alloy. Good resistance to corrosion and excellent resistance to extreme temperatures, both high (600°C) and low (-250°C).
- **Code M<sub>4</sub>: Monel®400.** A nickel (63%) and copper (23%) alloy. High resistance to corrosion in saline, caustic and acid environments (hydrochloric acid, hydrofluoric acid, sulphuric acid) and at high and low temperatures. Good mechanical properties. Due to its copper content, it has low resistance to nitric acid and ammonia. Very often used in the naval sector.

## Synthetic or plastic materials

These materials are widely recommended for cases in which carbon lacks the adequate chemical resistance. They are manufactured with a PTFE base mixed with different additives and have very high chemical resistance. They withstand temperatures of up to +240°C. Their use is limited to low pressures and speeds (PV factor).

- **Code Y:** Glass-filled
- **Code Y<sub>1</sub>:** Graphite-filled PTFE

## Secondary seals

### • Code P: Nitrile butadiene rubber NBR.

For working with water, oil, grease, etc. Temperature resistance from -30°C to +100°C.

### • Code H: Hydrogenated NBR.

Excellent resistance to lubricants and products refrigerants at temperatures of up to + 150°C .

### • Code N: Chlorobutadiene rubber Neoprene® or CR.

For fluids such as refrigerants, ozone, glycols, etc. Temperature resistance of from -40°C to +100°C.

### • Code E: Ethylene-propylene diene monomer EPDM.

Good behaviour in the presence of hot water, steam, acetone, alcohol, etc. Temperature resistance from -40°C to +120°C.

### • Code X: CEthylene-propylene rubberhardened with peroxide (EPDMPX).

Good behaviour in the presence of hot water, steam, acetone, alcohol, etc. In contact with steam up to +130°C in continuous operation and peaks of +150°C.

### • Code S: Methyl-vinyl silicon rubber MVQ.

Indicated for applications at low temperatures from -60°C to +200°C.

### • Code V: FKM.

High chemical and temperature resistance. Withstands temperatures of -15°C to +200°C except in hot water applications, in which case the temperature should not exceed 120°C.

### • Code K: Perfluorelastomer rubber FFKM.

Excellent chemical resistance to a wide range of working fluids. Withstands temperatures ranging from -30 to +250 or +320°C depending on the type.

### • Code M: FEP encapsulated seals.

Their chemical resistance is similar to that of PTFE. They are suitable for working at high temperatures ranging from -15°C to +200°C. Their main problem is the plastic behaviour of their surface, which makes them difficult to assemble in closed housings and they have a greater risk of being damaged.

### • Code A: Tetrafluoroethylene rubber, Aflas® or TPE/P.

A material with high chemical resistance to most products and suitable for working with steam at temperatures up to +170°C and lubricants at temperatures up to +200° C.

### • Code G:

Non-elastomer material with a graphite base used for high temperature applications. Withstands temperatures up to +400° C

### • Code T: Polytetrafluoroethylene PTFE.

High chemical resistance to practically all substances. Withstands temperatures ranging from -200°C to +260°C.

## CHEMICAL RESISTANCE CHART

## Chemical resistance chart

The information in the following table refers to the chemical compatibility of mechanical seals with fluids, and should be considered as a general guideline for an initial orientation in the selection of a mechanical seal. For technical or economic reasons, other types of mechanical seals with different materials than those indicated here may be proposed.

Today, many demanding industrial sectors need sealing systems that guarantee safety for both people and facilities.

It is very important to offer quality products that are resistant to extreme conditions such as high pressures and temperatures and that also guarantee impeccable sealing.

We offer a wide range of:  
single and double cartridges ...

## Cartridge Seal

**Cartridge Seal**

## Rubber Products

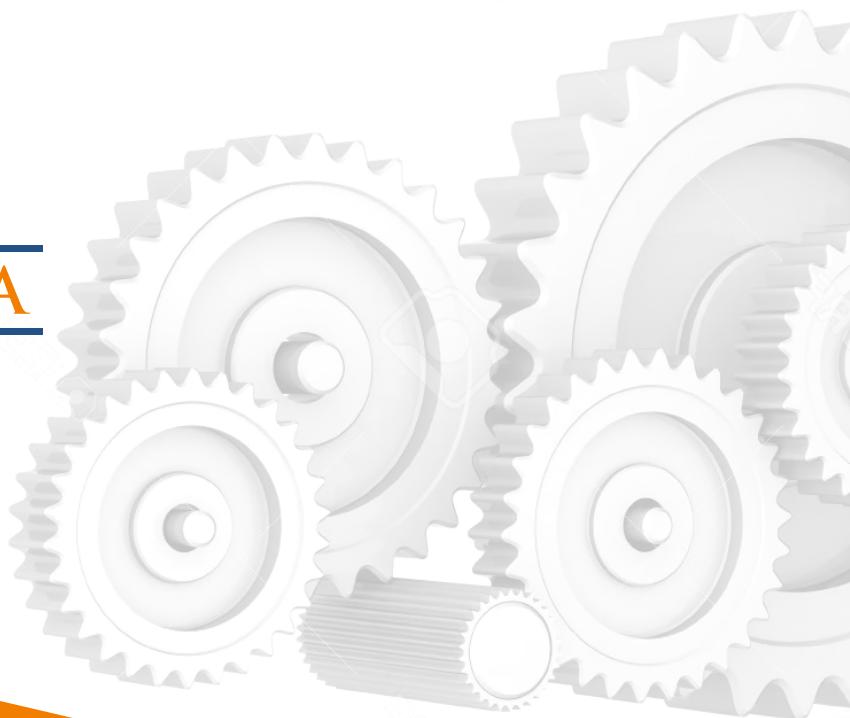

**ACCURA SEALS**  
An ISO 9001:2008 Company

**Rubber Gaskets & Components**

**Rubber Components**

AN ISO 9001-2015 COMPANY

### Company Address

Gala No. 7, Muntaha ,  
Momin Nagar, Station Road,  
Jogeshwari (W), Mumbai - 400102.

### Workshop Address

F-107, Shreepal Industrial Estate, Near  
Gulshan Hotel, Oshiwara, S.V. Road,  
Jogeshwari (W), Mumbai - 400102.

### Registered Office.

402, Assiddik, Momin Nagar,  
Station Road, Jogeshwari (W),  
Mumbai - 400102.
